***Film flakes and fibres from +30% moisture and direct feed
from wash lines to $\pm$ 1% agglomerated pellet !!***

Models available ; DW-250, DW-300,DW-350,DW-380

From 

The product image is for reference only.

Capable of reducing > 30% moisture in shredded, washed / rinsed PE & PP plastic films and fibres down to < 3% at high output rates (more usually < 1%) .

Can work with a variety of polymers including PP and PE Films, multi layer plastic films, PP Woven Bag Rafia, PP Rope Fibres, EPS, Non wovens and Diaper wastes.

This squeezer drier technology offers an ability to both dewater, and heat the squeezed plastics, then extruding the resultant dried material through a die with a face cutter thus pelletising the extrudate into small (variable by operator) dense pellets, for onward transport to storage or further processing by extrusion, moulding, blending or intrusion in its now dry dense form.

Production through the various models in the range offers throughputs from 200 to 1,250 kgs per hour for each drier (can be twinned for higher outputs) .
