

Critical Examination Certificate for X-Ray Inspection Equipment, Ionising Radiation Regulations 2017 (Reg. 32 (2))

Certificate No: 560018609 -170726-CEX

The examination after installation, service repair or annual validation visit comprised the following:

Safety features: All interlocks and emergency shut-off systems have been demonstrated to fail-safe and operate to the desired specification. In particular, the trigger of any interlock causes the generation of X-rays to cease and such generation does not automatically recommence when the interlocks are rearmed.

Warning devices: All required hazard warning notices and status warning lamps are present and correct.

Radiation Survey: A composite radiation survey has been conducted around the equipment for detecting the presence of leakage beams and enhanced radiation levels. All accessible exposure rates are confirmed as below 1 micro Sievert per hour ($\mu\text{Sv/h}$) up to the maximum operating parameters of the machine stated below:

Customer and machine details

Customer	ESE Engineering	Customer contact	Scott Gifford
Inspection date	17/07/2026	IJ Job number	
Machine type	IX-GN-4044-S	Serial number	560018609
Max irradiation setting	74.2 kV	Max irradiation setting	3.95 mA

Dosimeter details

Dosimeter type	RadEye G20-ER10	Model reference no.	42506/8710
Dosimeter serial no.	32567	Ishida reference no.	558
Calibration date	17/07/2026	Calibration due	17/07/2027

Radiation survey results

Maximum exposure rate	0.12 $\mu\text{Sv/h}$
-----------------------	-----------------------

The equipment may be safely operated without restriction by non-classified workers provided it is operated in accordance with the manufacturer's instruction and all warning notices are strictly observed. No modifications should be made unless undertaken by Ishida Europe and a full critical examination is subsequently made. If mechanically or forcibly moved or damage occurs, work must cease and the power isolated. Notify RPS/RPA/Ishida Europe immediately.
