DESCRIPTION

The FW755 wrap-around case packer is an electronic wrapping machine designed for packaging a wide variety of products, including bags, boxes, cups, flow-wraps and rigid containers, into a two-piece display box (tray and lid). Using suitable loading systems, products can be placed in the box flat, on their side or standing upright in one or more layers.

The machine has four stations: tray pick-up and deposit station, product loading station, tray sealing station, and station for placing lids from above.
